

MAP OF ENGLAND SHADED to show the prevalence of **CHOLERA** in the Several Districts DURING THE EPIDEMIC OF 1849.

Note, The Relative degree of Mortality is expressed by the darkness of the Shading. Thus in Hull where the Mortality was 287 in 10000 inhabitants the Shade is darkest, in Guildford, Surrey, where the Mortality was 5 in 10000 the Shading is imperceptible. The dates indicate the time at which the Epidemic broke out. The slight eruptions in 1848 and in the earlier part of 1849 are not noticed in the Map, as the dates refer exclusively to the principal Epidemic which prevailed in the Summer & Autumn of 1849. The Name of no town except Guildford is inserted where the rate of mortality was less in the year than 4 deaths from Cholera to 1000 inhabitants.
